Antiphony

Dialogue, what is your intent?

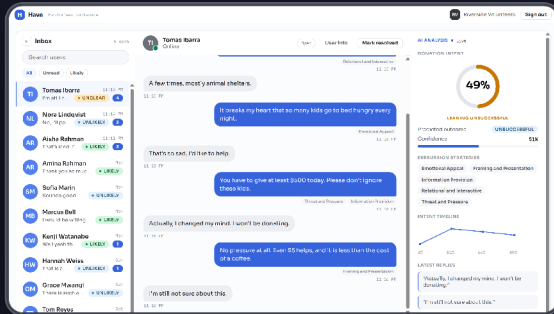

We built a model that follows both people in a conversation and predicts whether one of them will say yes.

Capstone Project Demonstration · 2026

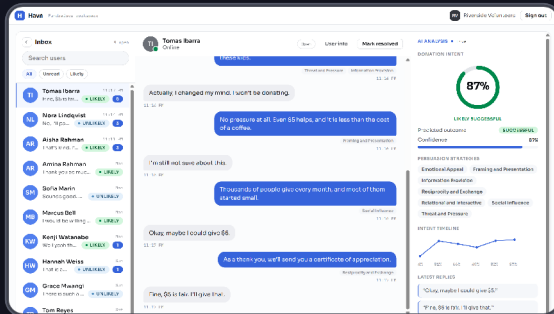

WHAT IT IS

Two speakers, one question

Most intent models read a chat as one block of text. Ours keeps the two speakers apart and looks at how one reacts to the other.

Mid-conversation · intent at 49%

Near commitment · intent at 87%

Havn is our demo app. It sits next to an agent's inbox and shows how likely the other person is to commit, and which persuasion tactics are being used.

HOW IT WORKS

From conversation to commitment

01

Dialogue in

The conversation comes in as alternating turns from two people.

02

Turn encoder

DeBERTa-v3 encodes each turn on its own.

03

Split by speaker

The turns are sorted into two streams, one per speaker.

04

Directional cross-attention

Each reply looks back at what the other person just said.

05

Commitment trajectory

A GRU reads the turns in order, so it notices when someone warms up or backs off.

06

Prediction

What intent are they showing?

WHAT MAKES IT WORK

Why it works

It notices a change of mind

People say no and then yes. Because the model reads turns in order, a late switch still counts.

Speakers stay separate

Merging both sides into one text blurs who said what. We keep them apart.

Not tied to one kind of chat

The same model works on different kinds of conversations without changes.

Try it

The QR codes on the flap open both demos.
